Intro

The finite field (also known as a Galois field) with 256 elements is sometimes written with the following notation \mathbb{F}_{256} by mathematicians. Engineers and computer scientists often write GF(256) instead, which will be used for the rest of this paper. GF(256) is created by splitting the binary field GF(2) with a monic irreducible polynomial of degree 8 to form a field with 256 entries. A monic polynomial is a polynomial of a single variable with the coefficient of the highest degree being one.

Number of irreducible polynomials

The number of irreducible polynomials are given by Gauss's formula [Chebolu]:

$$\frac{1}{n} \left(\sum_{d|n} \mu(n/d) q^d \right)$$

The notation $d|n$ means the set of all positive divisors of n including 1 and n .

$\mu(x)$ is the Möbius function. This function is defined such that $\mu(1) = 1$.

For other values of x , it has the following properties:

$\mu(x) = 1$ if the prime factorization of x that is square-free (no prime factors with an exponent greater than one) and an even number of prime factors.

$\mu(x) = -1$ if the prime factorization of x that is square-free (no prime factors with an exponent greater than one) and an odd number of prime factors.

$\mu(x) = 0$ if the prime factorization of x has a squared prime factor (a prime factor with an exponent greater than one)

Using the above definitions:

$\mu(2) = -1$ since the prime factorization of 2 is 2 which is square-free with an odd number of factors

$\mu(4) = 0$ since the prime factorization of 4 is 2^2 has a squared prime factor

Number of irreducible polynomials in GF(256)

For $\text{GF}(256) = \text{GF}(2^8)$, the number of irreducible polynomials with Gauss's formula $q = 2$ and $n = 8$:

$$\begin{aligned} & \frac{1}{8} \left(\sum_{d|8} \mu(8/d) 2^d \right) \\ &= \frac{1}{8} \left(\sum_{d \in \{1, 2, 4, 8\}} \mu(8/d) 2^d \right) \\ &= \frac{1}{8} (\mu(8/1) 2^1 + \mu(8/2) 2^2 + \mu(8/4) 2^4 + \mu(8/8) 2^8) \\ &= \frac{1}{8} (\mu(8) 2^1 + \mu(4) 2^2 + \mu(2) 2^4 + \mu(1) 2^8) \\ &= \frac{1}{8} (-2^4 + 2^8) \\ &= \frac{1}{8} (240) \\ &= 30 \end{aligned}$$

So there are 30 irreducible polynomials splitting $\text{GF}(2)$ into $\text{GF}(256)$.

Minimum primitive element

Call α the minimum primitive element of $\text{GF}(2^8)$. By raising α to successive powers, all non-zero elements of the field are generated: $\{\alpha^0, \alpha^1, \alpha^2, \dots, \alpha^{254}\}$.

The below table gives all irreducible polynomials in $\text{GF}(256)$ in algebraic, decimal, and hexadecimal format along with the minimum element α in algebraic and decimal format.

The irreducible polynomials were found using Wolfram Alpha by entering the expression $\text{GF}(256)$ and expanding the “characteristic polynomial” view. Algorithms for finding irreducible polynomials are given by [Kerl]. The minimum primitive element was found by a C++ program which sequentially tested elements until finding one that generated the entire field.

Table 1: GF(256) irreducible polynomials

Irreducible polynomial	Poly (dec)	Poly (hex)	Min primitive element	Elem (dec)
$x^8 + x^4 + x^3 + x + 1$	283	0x11B	$x + 1$	3
$x^8 + x^4 + x^3 + x^2 + 1$	285	0x11D	x	2
$x^8 + x^5 + x^3 + x + 1$	299	0x12B	x	2
$x^8 + x^5 + x^3 + x^2 + 1$	301	0x12D	x	2
$x^8 + x^5 + x^4 + x^3 + 1$	313	0x139	$x + 1$	3
$x^8 + x^5 + x^4 + x^3 + x^2 + x + 1$	319	0x13F	$x + 1$	3
$x^8 + x^6 + x^3 + x^2 + 1$	333	0x14D	x	2
$x^8 + x^6 + x^4 + x^3 + x^2 + x + 1$	351	0x15F	x	2
$x^8 + x^6 + x^5 + x + 1$	355	0x163	x	2
$x^8 + x^6 + x^5 + x^2 + 1$	357	0x165	x	2
$x^8 + x^6 + x^5 + x^3 + 1$	361	0x169	x	2
$x^8 + x^6 + x^5 + x^4 + 1$	369	0x171	x	2
$x^8 + x^6 + x^5 + x^4 + x^2 + x + 1$	375	0x177	$x + 1$	3
$x^8 + x^6 + x^5 + x^4 + x^3 + x + 1$	379	0x17B	$x^3 + 1$	9
$x^8 + x^7 + x^2 + x + 1$	391	0x187	x	2
$x^8 + x^7 + x^3 + x + 1$	395	0x18B	$x^2 + x$	6
$x^8 + x^7 + x^3 + x^2 + 1$	397	0x18D	x	2
$x^8 + x^7 + x^4 + x^3 + x^2 + x + 1$	415	0x19F	$x + 1$	3
$x^8 + x^7 + x^5 + x + 1$	419	0x1A3	$x + 1$	3
$x^8 + x^7 + x^5 + x^3 + 1$	425	0x1A9	x	2
$x^8 + x^7 + x^5 + x^4 + 1$	433	0x1B1	$x^2 + x$	6
$x^8 + x^7 + x^5 + x^4 + x^3 + x^2 + 1$	445	0x1BD	$x^2 + x + 1$	7
$x^8 + x^7 + x^6 + x + 1$	451	0x1C3	x	2
$x^8 + x^7 + x^6 + x^3 + x^2 + x + 1$	463	0x1CF	x	2
$x^8 + x^7 + x^6 + x^4 + x^2 + x + 1$	471	0x1D7	$x^2 + x + 1$	7
$x^8 + x^7 + x^6 + x^4 + x^3 + x^2 + 1$	477	0x1DD	$x^2 + x$	6
$x^8 + x^7 + x^6 + x^5 + x^2 + x + 1$	487	0x1E7	x	2
$x^8 + x^7 + x^6 + x^5 + x^4 + x + 1$	499	0x1F3	$x^2 + x$	6
$x^8 + x^7 + x^6 + x^5 + x^4 + x^2 + 1$	501	0x1F5	x	2
$x^8 + x^7 + x^6 + x^5 + x^4 + x^3 + 1$	505	0x1F9	$x + 1$	3

Number of primitive elements

Consider a term $\gamma = \alpha^n$. If γ raised to successive integer powers generates $\{\gamma^0, \gamma^1, \gamma^2, \dots, \gamma^{254}\}$ all non-zero elements of the field, the γ is also a primitive element.

The number of primitive elements for GF(q) is given as $\phi(q - 1)$ where ϕ is Euler's totient function [Kaliski].

$$\phi(n) = n \prod_{p|n} \left(1 - \frac{1}{p}\right)$$

where $p|n$ gives the distinct prime factors of n

For $\text{GF}(256)$:

$$\phi(256 - 1)$$

$$= \phi(255)$$

$$= 255 \prod_{p|255} \left(1 - \frac{1}{p}\right)$$

$$= 255 \prod_{p \in \{3, 5, 17\}} \left(1 - \frac{1}{p}\right)$$

$$= 255 \left(1 - \frac{1}{3}\right) \left(1 - \frac{1}{5}\right) \left(1 - \frac{1}{17}\right)$$

$$= 128$$

There are 128 primitive elements of $\text{GF}(256)$.

Table of primitive elements

This table of primitive elements was found by a C++ program which took the minimum primitive element for each of the 30 irreducible polynomials in GF(256) and tested each power greater than 0 to see if it generated each field element. The same values occur in all 30 irreducible polynomials.

Table 2: 128 primitive elements of GF(256)

α^1	α^{64}	α^{128}	α^{193}
α^2	α^{67}	α^{131}	α^{194}
α^4	α^{71}	α^{133}	α^{196}
α^7	α^{73}	α^{134}	α^{197}
α^8	α^{74}	α^{137}	α^{199}
α^{11}	α^{76}	α^{139}	α^{202}
α^{13}	α^{77}	α^{142}	α^{203}
α^{14}	α^{79}	α^{143}	α^{206}
α^{16}	α^{82}	α^{146}	α^{208}
α^{19}	α^{83}	α^{148}	α^{209}
α^{22}	α^{86}	α^{149}	α^{211}
α^{23}	α^{88}	α^{151}	α^{212}
α^{26}	α^{89}	α^{152}	α^{214}
α^{28}	α^{91}	α^{154}	α^{217}
α^{29}	α^{92}	α^{157}	α^{218}
α^{31}	α^{94}	α^{158}	α^{223}
α^{32}	α^{97}	α^{161}	α^{224}
α^{37}	α^{98}	α^{163}	α^{226}
α^{38}	α^{101}	α^{164}	α^{227}
α^{41}	α^{103}	α^{166}	α^{229}
α^{43}	α^{104}	α^{167}	α^{232}
α^{44}	α^{106}	α^{169}	α^{233}
α^{46}	α^{107}	α^{172}	α^{236}
α^{47}	α^{109}	α^{173}	α^{239}
α^{49}	α^{112}	α^{176}	α^{241}
α^{52}	α^{113}	α^{178}	α^{242}
α^{53}	α^{116}	α^{179}	α^{244}
α^{56}	α^{118}	α^{181}	α^{247}
α^{58}	α^{121}	α^{182}	α^{248}
α^{59}	α^{122}	α^{184}	α^{251}
α^{61}	α^{124}	α^{188}	α^{253}
α^{62}	α^{127}	α^{191}	α^{254}

Curiously, the sequence of exponent values $\{1, 2, 4, 7, 8, 11, 13, 14, 16, 19, 22, 23, 26, 28, 29, 31, \dots\}$ are non-multiples of Fermat numbers. A Fermat number is of the form $2^{2^n} + 1$. This corresponds to On-Line Encyclopedia of Integer Sequences (OEIS) entry

A080308 [Sloane].
